ACKNOWLEDGEMENT

We extend our gratitude to Tilottama Municipality (MOFALD), Statistics and GIS Section, for entrusting us with the project work and their support.

We would like to express our sincere gratitude to Mr. Pradeep Ban, Section Engineer of Tilottama Municipality and Mrs. Manish Khanal and Mrs. Griraj Dumrea, Engineer of Statistics and GIS Section of Tilottama Municipality for their support and invaluable suggestions for the project.

We are also great full to Executive officer of Tilottama Municipality, Engineer and the entire staff member and ward secretaries of Tilottama Municipality for their coordination, feedback and suggestion during fieldwork of the project.

We appreciate the efforts of all the ward members, local representatives of different political parties and public of Tilottama Municipality for their cooperation during the field survey works and their active participation during the street naming process. Finally, yet importantly, we would like to express our thanks to all the project team for their efforts in this project.

Chapter 1. Introduction

Street Addressing

Street addressing is an exercise that makes it possible to identify the location of a plot or house/building claiming is to designate an address using a system of maps and signs assigning numbers or names of streets and houses/buildings. This concept may be extended to other urban networks and services in addition to buildings. Designation of a house address is defined in relation to its access street. Street addressing is more than just a signaling operation. It is also an indispensable foundation for urban management. This operation of house addressing also serve to improve urban and municipal management. One's home address is an integral part of personal identification. It is found on voter identification and social security cards in most of the cities. Street addressing provides an opportunity to create a map of the city used by different units of the municipality, collects a significant amount of information about the city and its dwellers and set up a database on the built environment. Information gathered is associated with an address thus making it easily locatable. This database, which takes the form of GIS, is the major innovation of street addressing initiatives particularly in Nepal with rapidly growing urban areas. Urban information database in conjunction with a street addressing plan and a street index can be used for various applications and benefit the people, municipalities and the private sector.

Importance of Street Addressing

Street Addressing serves several purposes for different governing bodies:

For city dwellers

Facilitates identification and location by means of a simple easy, low cost, user-friendly identification system.

Assists emergency services (ambulances, fire station, police etc.)

Helps several urban service delivery functions, taxis, mail delivery and home delivery of goods and services.

Enable people to get around the city and find addresses quickly and more easily.

For municipality

It increases municipal revenues and improves urban management with this tool.

Tools for planning and managing municipal services by technical departments. The identification of public assets (Street system facilitate their length, number and condition) allows a monitoring system to be put in place to assist with urban planning and programming of investments, about streets, different utility networks and facilities.

Tools to improve local tax collection such as house and land tax/property tax, business tax using information gathered by street addressing initiatives. Creating database of taxable individuals or businesses and thereby more accurately determine the tax base and increase in taxation.

Combat epidemics by monitoring the propagation of diseases.

For the private sector and other utility service providers:

It enables utility service providers to manage their networks more effectively.

Street addressing helps water, electricity, telecommunications and postal service to maintain their networks and collect fees.

Theoretical Background on Street Addressing

The concept of street addressing is based on the following principles.

Streets are codified quickly, until they can be named. The street numbering system should allow for:

Easy identification within the city

Forecasts of urban development

The principle of the operation is based on the application of a coding system that assigns a code to every street and building. The system makes it easy for users. Since streets are numbered according to a predefined order of progression, it is easy to locate.

An entryway numbering system is identified using the metric system, changes in each plot or building can be monitored, through periodic systematic visual inspections.

Types of Addressing System

There are diverse types of addressing systems. Basically, two main types': metric and non-metric systems are often used in cities of the world. Besides this, there are other systems known as block numbering and sequential numbering along/around an access way.

Metric System

Each building along an access way is given a number that equals the distance measured in meters from the access way's starting point to the main gate (entrance) of the house/building. This is the basic principle of a metric system while implementing addressing system. In other words, structures are assigned even or odd numbers corresponding to the distance between the building/house main entrance and the beginning of the street segment. The numbering sequence does not necessarily start with 1, 2, 3 even if the buildings/houses are the first building or house at both sides of an access way e.g., a building with its main entrance or gate 10 meters from the starting point. It will have no. 10, even if it is the first building along an access way. The benefit of this system is if a change occurs in the urban site like the demolition, replacement or construction of a new house/building, or vacant plot turned into a new building, will not affect the existing number flow. New building will be given new numbers, which do not conflict with the numbers already given. There will be no occurrence of the repetition of the number or number flow. The metric system method follows with the odd and even rule in a road segment. If a building on the right side of an access way has its main gate or entrance at 13 meters from the starting point, number 12 or 14 will be allocated for that building. The same rule applies to even distances measured for buildings situated on the left side of an access way. In this method vacant sites will not be allotted a number as there is no certainty on how many buildings will be constructed on that vacant plot. But the site can be identified if necessary in relation to the next building.

Non-Metric System

As the metric system, the non-metric system numbers buildings from the access way's starting point. However, the numbering flow increases sequentially in an even or odd manner along the right and left side of the access way. On the right side, the first building is given number 2, the next number 4 and then 6, 8 and so on. On the left side, the first building is given number 1 and the number flow continues with 3, 5, and 7 and so on. There is no interruption in these sequences. Vacant sites do receive a number. It is an easy and simple system to identify buildings. As long as there are no major changes in the building layout or no subdivisions of sites, the system is suitable. Indeed, this system is used in many countries around the world. A problem arises when buildings are demolished (resulting in a gap in the existing sequential numbering), or when new buildings are erected. This influences the existing numbering sequence. To avoid renumbering, the gaps must be tolerated and the use of appendixes to existing numbers is essential to identify new buildings. This situation distorts the original concept of sequential numbering along the access way. Summing up, the non-metric method tends to break its own rules in numbering if the building pattern changes, thus losing all its simplicity and requiring a review of the numbers. This will cause inconvenience to dwellers. The metric system on the other hand is designed to avoid the problems encountered by the non-metric system as it uses non-continuous numbers. The only inconvenience in the metric system is the fact that in long access ways high building numbers will be necessary.

Other Systems

Block numbering and sequential numbering along/around an access way are the other methods. It neither follows a metric or non-metric way of numbering. Block numbering system was used in Kathmandu to identify buildings. As it has some drawbacks like a new building within a block gets the number following the last number allocated. As such the number has no relationship to the physical location of the building. When there are many buildings in each block, it is impossible to find a particular by means of its block and house number alone. There are other drawbacks also in this system. UDLE previously introduced the non-metric system in smaller towns in Nepal. It was superior to block system, but this system loses consistency when the urban structure changes significantly.

Chapter 2. Street addressing in Tilottama municipality

Introduction

Tilottama Municipality, a beautiful place, is in the district of Rupandehi, Lumbini zone, Western Development Region of Nepal. Tilottama Municipality was established in the year 2014 AD with the 17 wards merge.

Rationale of Metric Addressing System

From the experiences of other cities in Nepal using block/sequential or the non-metric system, neither of these systems seems to be suitable for Tilottama. In view of its uniqueness and ability to accommodate new buildings, the metric system seems to be more suitable and convenient to implement in Tilottama Municipality. The advantages of metric system are:

An easy method to use reference for both citizens and outside visitors to locate the addresses as all the access ways are identified with unique names along with the location (neighborhood name and sectoral reference) and buildings are identified based on the access ways. For an instance, an address is referred as:

226 ABC Road, Tilottama North Tilottama Municipality

A logical and extensible framework, not requiring periodic renumbering and therefore not losing consistency.

An easy and quick system to implement, avoiding access way naming issues when they are deemed problematic. Instead of access way names, codes can be used for rapid appraisal and database maintenance. Names can be incorporated as and when designated.

Numbers are allocated to buildings doorways with measured distances along the access way beginning at the access way's starting point and progressively increasing towards its ending point. Buildings on the right side of an access way are given even numbers and those on the left side are given odd numbers.

An easy linkage to other municipality systems that benefit from an improved addressing system such as the cadaster and tax system, utilities, emergency services and others. On the lights of the above advantages over the other addressing systems, this system can be stated as clear, coherent, which facilitates efficient delivery of the municipal services. It improves the performance of emergency services, utility agencies, commercial enterprises, transport & service delivery, tourism industry and overall contributes to the increase of the city's economic performance. This system of addressing and associated applications could be incorporated into the broader notion of municipal services and can be encompassed to other operations such as street cleaning or public transportation.

Implementing Metric Addressing System in Tilottama Municipality

The methodology used to implement the metric addressing system in Tilottama is described in full detail in the Chapter 3: Implementation Specification. In short, the following steps are taken:

Division of Tilottama Municipality into five addressing zones based on physical boundaries defined by the major thoroughfares and rivers

Coding and naming of all access ways

Metric numbering of all buildings (Future Work)

Placement of street signage and house number plates

Development of access way and building addresses geo-database

Public awareness and campaign through local media

Institutional capacity building of the municipality to sustainably implement the addressing system

Chapter 3. Implementation specification

Introduction

This chapter presents the methodological steps adopted for addressing access ways and buildings in Tilottama Municipality. These methodological steps are the basic implementation practice and form a guideline for future extension and updates of the addressing in the municipality.

Followings are the implementation methods for addressing in Tilottama Municipality:

- Preparation of base map
- Division of municipality into addressing sectors
- Access way identification and codification
- Access way naming
- Identification of buildings and numbering of doorways
- Establishment of access way signage and building number plates
- Development of addressing system database
- Public awareness campaigning

Digital Base Map Preparation

Preparation of cartographic base map showing the buildings, streets, administrative boundaries, topographic and other land features is the first step in implementing an addressing system in a municipality. The building footprints, street layouts, administrative boundaries and topographic features form a baseline spatial data for access way house addressing. In the current practice, base map is prepared by adopting digital photogrammetry and remote sensing techniques using aerial photographs and high-resolution satellite imageries. Buildings, road, other physical and topographical features are digitally captured by digitizing over geometrically corrected (orthorectified) aerial and satellite images and their respective 3D models. The maps thus prepared are ground verified and the captured digital data are maintained in simple CAD formats and/or maintained in GIS formats with appropriate attribute data for each captured feature. The digital base map of Tilottama Municipality was prepared following this approach. The base maps contain the following spatial data:

- Aerial and high resolution Quickbird satellite ortho-photo
- Terrain topography-contours and spot level, digital elevation model (DEM)
- Administrative ward boundaries
- Characteristics topography (embankment, escarpment, cliff, quarry, pit, peak etc)
- Geodetic control points
- Hydrography (rivers and streams)
- Land Cover
- Building footprints
- Other physical structure

Land Use for Specific Purposes (industrial zone, army/police barrack, parking lot, cremation ground, cemetery, temple compound periphery, institutional compound periphery etc)

Street network and transportation infrastructure

Utility Infrastructure (water supply and sewerage, electricity, telecommunication)

It is also important to know if there is existing street names and house numbering system already implemented in a part or the whole of the municipality. The aim is to retain the existing street names already in use. The stock of all the streets and their existing names are collected and showed on the map. Besides the existing names, the street base data should also contain other attributes such as the width of the road, category, status, surface type, traffic type/volume and others if possible to help categorize the streets and support other addressing activities.

Defining Addressing Sectors

The first step in the implementation process of the addressing system in Tilottama is the division of Tilottama's territory into addressing sectors or zones. The rationale behind this division is to establish a first level of geographical reference for access ways & buildings addresses. This geographic reference corresponds to familiar places such as neighborhoods, local place names, administrative unit, city zones or simply geographic location, which the local residents as well as outsiders can easily refer to and understand. This also simplifies the handling of numbering the access ways and buildings due to smaller areas covered. Further, such division also helps other municipal applications and utilities to manage their services in smaller coverage areas. The divided sectors are given an identifier in a form of a prefix or suffix for easy location.

The division of sectors can be done based on commonly known places such as neighborhood (Tole/settlement), administrative units (wards), and homogeneous city blocks with Regular Street and building patterns etc. However, in the case of Tilottama Municipality, none of these seems to be suitable due to the following reasons.

Neighborhood or Tole boundaries are usually not well-defined or poorly understood and delineating the boundaries requires local consultations, which may require lot of exercise to reach a consensus. There are just a few TLO (Tole Lane Organizations) and utility consumer forum in Tilottama Municipality; hence delineating addressing sectors based on such their boundaries does not seem to be practical in the case of Tilottama Municipality.

Ward boundaries are well defined and are used as administrative units' boundaries. However, the ward boundaries are prone to changes due to political and administrative causes. As a consequence, designated sector codes require updating and changes as and when necessary, which does not seem to be practical and sound practice.

Street in Tilottama have irregular pattern; Core city is highly dense whereas outskirts area is quite scattered. The city is growing outwards in heterogeneous pattern. Hence, division of addressing sector based on street and homogeneous built-up layout might prove to be more complex and difficult to comprehend.

Considering the implementation issues of the aforementioned addressing sector division frameworks, the most suitable sector division framework is deemed to be an “Ad-hoc Addressing Sectors” divided by the combination of natural and physical boundaries. In the case of Tilottama Municipality, the addressing sectors are divided based on physical boundaries defined by the major thoroughfares.

Based on this, the municipality is divided into five addressing sectors and named after the geographic locations. These addressing sectors are named as Tilottama Core, TilottamaNorth, Tilottama South, Tilottama East and TilottamaWest. The boundary definitions of these sectors are presented below:

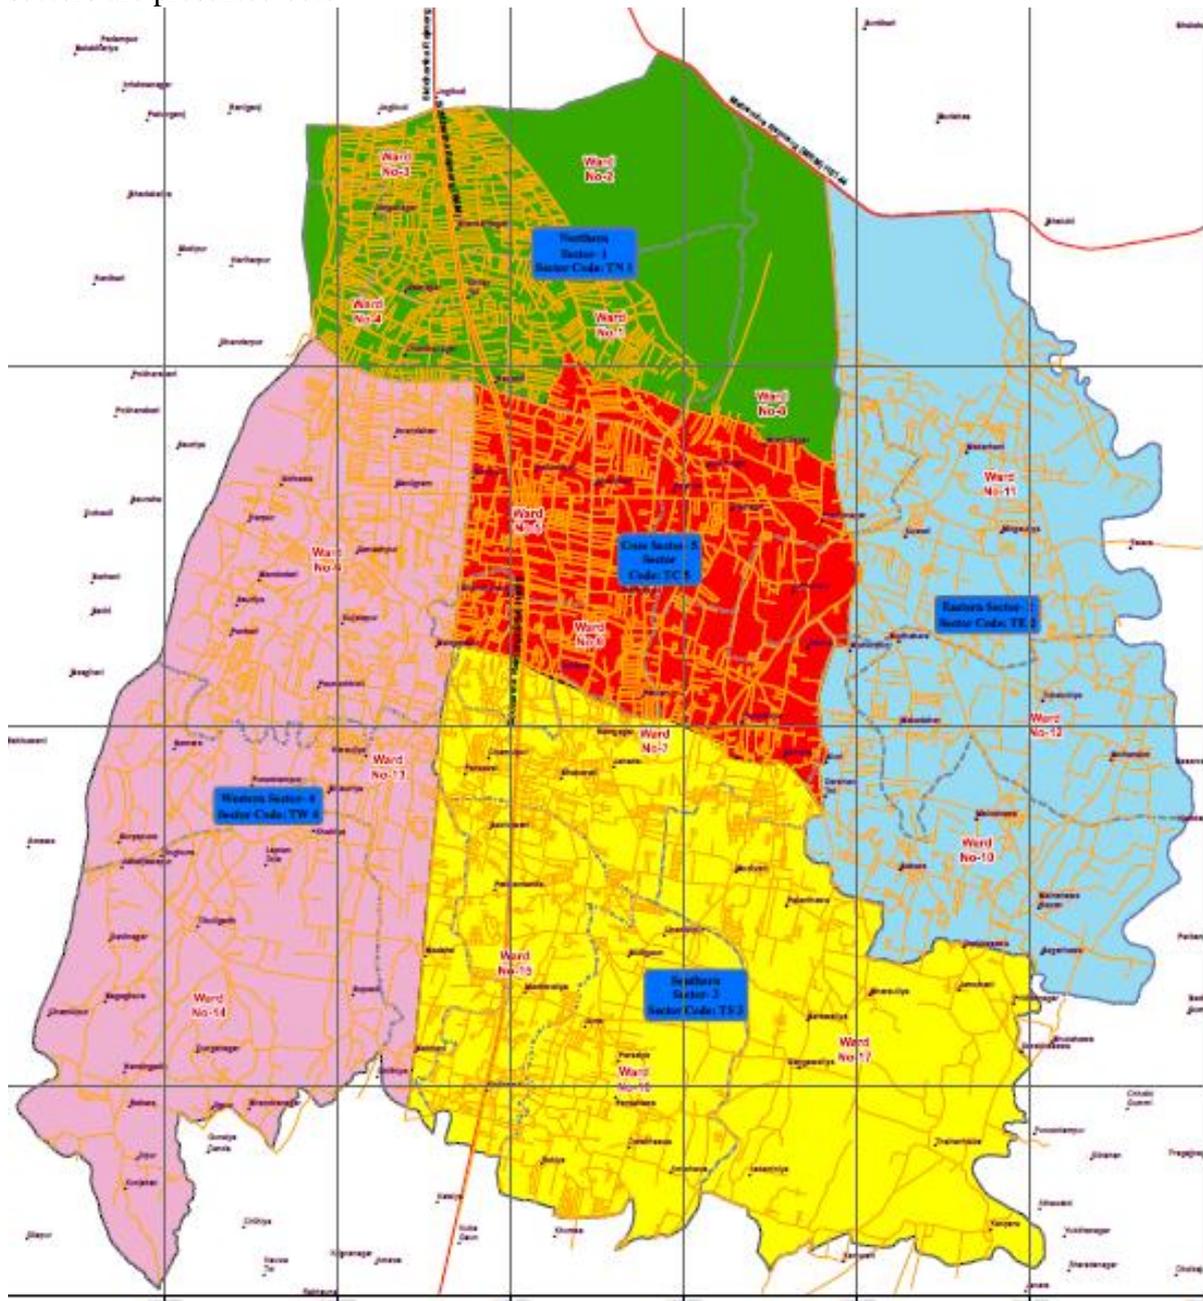

Figure 1 Addressing sectors in Tilottama Municipality

These addressing sectors are denoted using the names as specified above with the equivalent translation in the Nepalese language. The sectors are given a code (abbreviations) using the initials as TC for Tilottama Core, TN for TilottamaNorth. The rationale behind using the

alphabetical code is that it makes much simpler to apprehend the geographical location of the sectors using geographical direction references (as South, West) in contrary to using numeric digit that denotes the sector. Other advantage of using alphabetic code is that the sector and the access way codes are distinctly identifiable in the codification system and that the access way code may be represented using long digits (more than three digits) as the preceding sector code is represented by a distinct alphabetic code (e.g. BC0004 denotes access way 4 in Tilottama Core sector). The following table presents the addressing sector codes and their equivalent representations in Devnagari (Nepali) script.

Table 1. Addressing sector codes and equivalent Nepalese representations Sector Code

Sector	Code	Equivalent Nepalese Name	Equivalent Nepalese Code
Tilottama Core	TC	तिलोत्तमा मध्य	ति. म
Tilottama East	TE	तिलोत्तमा पूर्व	ति. पू
Tilottama West	TW	तिलोत्तमा पश्चिम	ति. प
Tilottama North	TN	तिलोत्तमा उत्तर	ति. उ
Tilottama South	TS	तिलोत्तमा दक्षिण	ति. द

Coding Access Way

Alphanumeric coding and street naming are used in coding the access way. Following are the logical steps implemented for coding the access ways:

Identification and Ground Verification of Access Ways

The first step taken is to identify the access way on the prepared base map and its verification on the ground. A clear starting and ending point is identified for every access way with the local participation and the assistance of the municipality and the concerned ward secretary. In principle, the exact starting point of an access way is the intersection point of the centerlines of two access way. The ending point is the junction point of other access way. The identification of the starting and ending points of the access way delineates its segment length thus enabling the naming of the segment. The identification of the starting point also defines the origin for building numbering in metric system. A starting point, by definition is located on the eastern side of an access way if it is aligned in east-west direction, referring to the north orientation. If the access way is north south aligned, then the starting point is on the southern side. If the alignment of an access way is not exactly north-south or east-west, the starting point is defined by the angle by which the access way deviates from the north-south or east-west line. If the angle is smaller than 45° referring to the north-south line, the starting point is the point in the southern side. If the angle is 45° or smaller referring to the east-west line, the starting point is at the eastern side of the access way. [Refer Figure 4]

In most of the case the above defined convention does not seem to be practical as the originating point of an access way would start from the end of the road located too far from the active junction. Therefore, Major thoroughfares are considered as the reference of the starting of any access way. [Refer Figure 3]

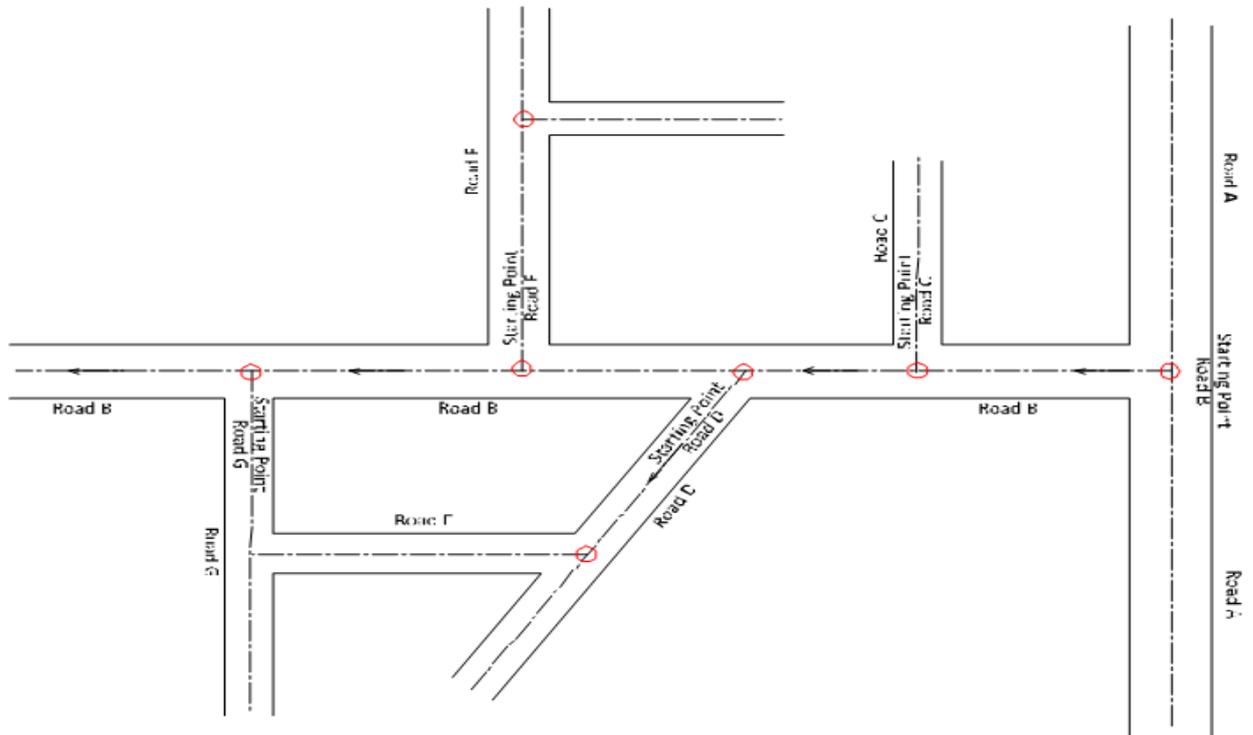

Figure 2. Access way of starting and ending points

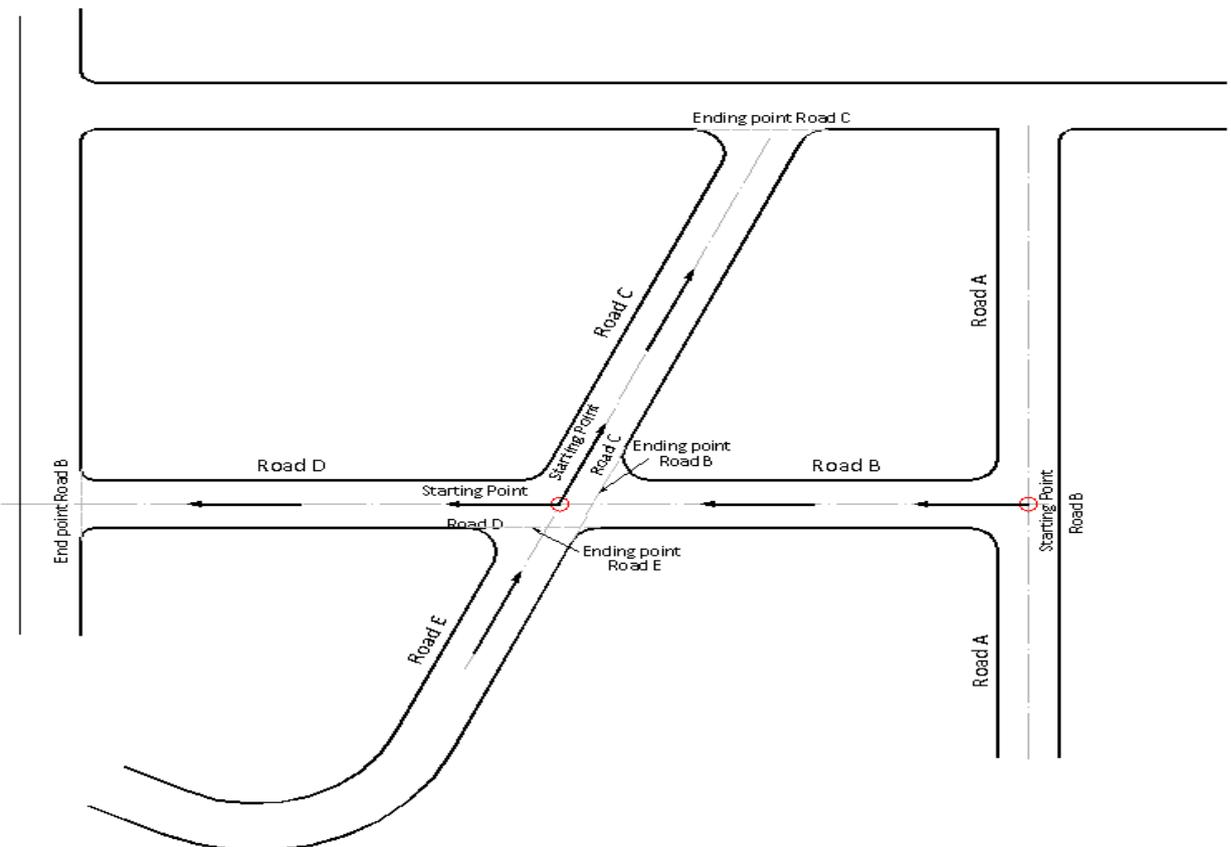

Figure 3. Access way-starting points in Tilotama Municipality

Special Cases of Origin

There are certain specific and unique cases of access way origination and location of building clusters in Tilottama that needs special provision which may be different from traditional metric convention for defining the origin of the access way and building numbering. These are categorized under special and unique cases and are defined here with suitable illustrations and diagrams.

Determination of Geographic Origin and Direction

The access ways with north-south orientation is “odd numbered” i.e. designated odd number codes and the access ways with east-west orientation is “even numbered” i.e. denoted with even number code. The access way starting in an east-west direction and acting as border between sector is included in the sector lying its south. Similarly, the north-south access way acting as the border between sectors is included in the numbering of the sector to its east. The numbering of these bordering access ways has to comply with the coding rules described.

Access Way Coding

Once the starting and ending point of an access way is defined, the access way is assigned a unique code with 3 digits (in the format 000). This unique access way code is preceded by the sector code (as defined above). Hence, the complete access way code is the combination of sector code and the access way code, which is denoted as shown. If in case the number of access ways increase in the future, the unique code can be extended to include 4 digits (in the format 0000). This is applicable as the preceding sector codes are denoted using alphabetic codes and hence may not pose difficult in reading due to long numeric digits.

Table 2. Access Way identification code ranges

Sector	Code	Access Way Code	Extended Access Way Code
Tilottama Core	TC	TC001-TC999	TC0001-TC9999
Tilottama East	TE	TE001-TC999	TE0001-TC9999
Tilottama West	TW	TW001-TC999	TW0001-TC9999
Tilottama North	TN	TN001-TC999	TN0001-TC9999
Tilottama South	TS	TS001-TC999	TS0001-TC9999

The access way identification code is primarily used for internal reference in Tilottama Municipality addressing database. It will also be used to identify unnamed access ways until these are named. If an access way gives a feeling of continuity, identification code has to be maintained. Main turning points and junction normally gives a feeling of ending an access way and starting the next one.

In some cases, the identification code is maintained beyond a turning point or junction, depending upon the nature of the access way. For common usage purposes such as mail postage, mapping and other applications where the access way code might need to be used, it is recommended to use only the significant code digit along with the sector code. For instance, TE0026 can be written only as TE26 for clarity and readability.

Coding Process

Access ways are coded progressively starting from one end of the designated addressing sector to the other end following a specific standard and numbering pattern. Consistency should be maintained throughout the coding process as well as for coding of new access ways. Certain exceptional cases may arise that needs to treat differently from the standard practice. These exceptional cases are described in Sub-section 3.4.6.

The major issue in coding process arises during the coding for new access ways and in cases if the codes are used as some sort of reference numbers. For an instance, assuming access way TE122 is the subsequent street after TE123, located in the same locality; which might not be the case if TE122 has been designated to a new access way located at the other end of the addressing sector. This issue is apparent as the existing access ways are coded progressively at the initial addressing stage, but the new access ways must be coded as they are newly built. This is where the continuity of the coding breaks as new access ways is designated with a subsequent code after the last assigned code. This issue cannot be completely resolved for the current metric system implemented in Tilottama Municipality. However, the complications that might arise can be mitigated by further sub-dividing the addressing sectors to manageable coding subdivisions. These coding sub-divisions are sub-units of the addressing sector and are only use for facilitating the access way coding by maintaining the consistency in coding and providing some degree spatial association in the access way codes. The following methodology has been adopted for coding sub-division and access way coding in Tilottama Municipality:

Sub-division of addressing sectors into coding sub-divisions each sector containing two to four sub-divisions. The sub-divisions are divided with reference to the pattern of the access ways with the major access ways, rivers or other features as the boundary thus giving a sense of locality/neighborhood.

Access way coding starts from the south-east (bottom-right) of each sub-division and follows the general convention origin and direction.

Coding in the first sub-division starts from the initial number and ends with the last number of access way. Additional 100 code numbers are allocated to accommodate 100 new access ways. For instance, the coding may start from 001 to 090 in a sub-division, but additional 100 more code numbers are reserved for this sub-division in case more access way are built in the future. Thus, the coding in this sub-division ranges from 01-090 with 01-190 reserved for new access ways. For convenience, the last code i.e. 190 in the above example can be extended to 199 so that the coding for the next sub-division in the same addressing sector may start from 201.

The second sub-division is the adjacent sub-division. The coding in this sub-division starts from the south-east following the general convention. However, the initial code is the continuation from the previous sub-division; in this example, the coding start from 201 and continues to the end number with 100 extra code numbers reserved for the new access ways in this sub-division.

The coding in sub-divisions for another addressing sector is done in similar fashion.

By adopting this technique, the code range is constrained to a small locality thus facilitating easy coding as well as creating some degree of spatial association within the access way codes.

Special Cases

These are some of the special cases that need to be treated differently during coding. These are referred as special cases and are presented here.

An identification code changes when the access way crosses the border between two sectors (i.e. the highway) even though the access way has a continuous character. In such cases, the access way retains its name but can be suffixed with road segment number or location name of the segment.

In Tilottama, building pattern or settlement pattern is either quite scattered or too dense so streets with very low density of building/settlement and those with only one point of exit are considered as dead-end streets. These types of streets are designated with codes analogous to any ordinary access ways. Such dead-end access ways are given the number of the street it comes onto, followed by alphabetic suffix A, B, C... Z. For instance, access way TN054 contains two dead-end streets along its length; these dead-end streets are numbered as TN054A and TN054B. The alphabetic suffixes representing the number of dead-end streets starting from the origin of the parent access way TN054. In some cases, these dead-end streets also contain branch streets. Such branch street is also given the number of street it comes onto, followed by double alphabetic suffix, AA, AB...AZ. For instance, dead-end street TN054A contains one branch street along its length, this segment is numbered as TN054AA and dead-end street TN054B contains two dead-end streets along its length; these branch streets are numbered as TN054BA and TN054BB. The alphabetic suffixes representing the number of branch streets starting from the origin of the parent dead-end streets TN054A and TN054B.

An access way which has a different surface type throughout its length (e.g. black-topped in certain length and graveled in remaining) is coded with the same number irrespective of its surface types.

Access ways which do not have road status (temporary access ways) such as through unused land, along the sides of crop field bunds (cfnL) etc. are given the codes as per the above rules if and only if these access ways have been mapped.

Access ways which is newly constructed or to be constructed in future are allocated codes consecutive to the last number allocated, even if the new access ways are surrounded by existing access ways which means the code number does not follow the original order. But the odd & even number will follow in the new access way depending upon the access way's orientation with reference to the geographical direction

Figure 4. Way's orientation with reference to the geographical direction

Coding Public Squares, Intersections and Courtyards

Public squares, courtyards, major road intersections are designated with a unique code and name. These are codified about one of their component streets, usually the major or the more prominent street ending at the location. For instance, an intersection of access way TN222 (ending at the public square) and TN250 (starting at the public square), would have code “TN222.” The naming of such is done in the similar fashion as in access way naming.

Naming Access way

Access way naming is also one of the main tasks in addition to coding. The designation of access way names is done by adopting participatory appraisal approach with an active participation of local people and authorities. Upon the request of the municipality and technically supported by the consultant, each ward organized ward level meetings to identify the origin and the end points of the access ways and designate a commonly used names of each identified access ways. In practice, access ways are designated with names (terminologies) of deities and mythical figures, popular figures, martyrs, people’s movements, popular spot or location and other cultural terminologies. Certain naming convention should be followed such that the name would not offend certain group of people or prove to be controversial. Following are the points to be considered in the designation of the names:

- Names should not reflect political agenda
- Living individual’s name should not be used

Any name should be unique throughout the municipality i.e. there should not be repetition of the same name

Traditional and already existed name are maintained

The access ways are categorically designated into four types based on their widths. These categorical types along with the designated names is the full name of the access way. These categorical types are as follows:

Street Network Map Preparation

After the designation of access way name and building numbering is completed, the base map prepared for the assignment is finalized for publication and distribution. The street map should have following characteristics:

Street map should be composed at large scale, preferably at 1: 10,000 to 1: 5,000 scales.

Street map should clearly show each of the access ways with distinctive colors and/or cartographic symbols for each of the access way categories. The color selection should be such that the major access ways are more prominent than the minor access ways.

Toponyms of the places should be distinctly shown on the map.

The designated names of the access ways should be distinctly shown on the map. The designated names appear coincided with the respective access way or slightly offset on the side.

Prominent places such as public squares, town center, and round-about with designated names should be shown on the map.

Landmarks such as statues, temples, parks and others should be shown with their designated names.

Infrastructures/places of touristic attraction, businesses, commercial buildings, official buildings (governmental and international), banks, recreational (cinemas, theatres etc.), hotels, places/sites of historical and cultural importance and other important infrastructures/places should be shown with the designated names.

Services such as police stations, fire stations, hospitals/health posts, clinics, post offices etc. should be shown on the map with appropriate symbology.

Transportation services such as bus parks, taxi/auto stands, public parking space, petrol stations, service stations etc. should be shown in the map with appropriate symbology.

The direction of the traffic in one-way streets should be shown clearly with directional arrow. Streets with restricted access should also be shown on the map.

Routes for public transportation should be included on the map if possible.

The maps should contain reference grid index in alphanumeric codes such as A1, B2.... The major landmarks and the places of prominences situated geographically inside such reference grid should be listed outside the map frame with the designed names and reference grid index.

The contents of the maps should be properly shown in the legend with appropriate descriptions.

An index of all the access ways should be included on the map if possible or as a compendium accompanying the street map. The index is generally sorted and grouped in alphabetic order of the access way names with the references on the alphanumeric grid.

The map should be printed in color at appropriate paper size. If funding is available, a map book is recommended.

Installation of Maps in Public Places

Street map printed in larger sizes are placed at public places such as city center, bus parks, taxi stands, public services buildings, the municipality building, prominent places, public squares, tourist spots and other important locations. Such maps should clearly indicate the current position stating “You Are Here” (तपाईं यहा हुनहुन्छ) and marked with an arrow sign, such that the map reader is able to locate his/her current location and find the destination location with reference to the map.

Public Awareness and Campaignin

Public awareness campaigning informs local inhabitants about the street addressing operation, its advantages and its proper usages. The public should be informed of the anticipated benefits, in particular about increased facility or location security, ease of access and more efficient improved and effective public services. Effective public awareness campaign will result in a better understanding and in cooperation from the inhabitants without which, the operation runs the risk of not being completely effective. This task should be carried out by the municipal office. The campaigning can be carried out through local media via several mediums simultaneously.

Local radio

Local newspapers

Local television

Posters and pamphlets

Distribution of T-shirts and caps carrying the municipality's emblem and marked "Street Addressing Operation" to the addressing teams.

The awareness campaign should be launched to address the following issues:

Inform on new addressing system being implemented, its benefits and usages

Inform on new addressing sectors and their boundaries

Request for cooperation during installation of signage and building number plates

Request for registering and applying for permanent house address certificate

Instruct on correctly using/writing a personal address

The campaigning should also include workshops/presentation/meetings with other line agencies such as postal service, police, fire brigade, water supply and sewerage, telecommunication, electricity, cable network providers and others to inform them about the addressing system implemented and its usages in their operations. This shall also include the issue of data sharing and dissemination and its modality.

Addressing System Usage

The address is used for different purposes viz. mail postage, services customer cards, academic certificates, municipal certificates (birth, marriage, death and other certificates), tax

documents, land ownership certificates and various other legal and personal documents. As such, the address of an individual becomes his/her identity. Proper usage of one's address is important if it is to be used as a part of an identity. One of the components of public awareness is also to apprise the public to use the address properly. Below are the examples of proper usages of the addressing system.

Example 1:

*7 Tilottama Road, Ward No.2
Tilottama North
Tilottama Municipality*

Example 2:

*7 Tilottama Road, Ward No.2 TN
Tilottama Municipality*

Example 3:

७ तिलोत्तमामार्ग
वार्ड नं २ . तिलोत्तमा उत्तर
तिलोत्तमानगरपालिका

Example 4:

७ तिलोत्तमामार्ग
वार्ड नं. २ति. उ
तिलोत्तमानगरपालिका

Chapter 4. Addressing data management

Background

This chapter presents the framework for storing and managing the address data in GIS and database system. Proper management of the data enables efficient and easy usages as well as facilitates in updating and maintenance. The data model presents the design of the GIS database with its contents.

Street GIS and Address Database

The street GIS extends the Municipal GIS incorporating information of the designated names and the codes of each individual access ways. Besides the addressing data, the street GIS contains other attribute data related to the type of road, status and other physical properties, which provide vital information for the management of the road infrastructure. The database is maintained as a “relational database” such that each access way segment has its unique code (access way code), associated addressing parameters and other information. This unique code is the key field which is used to link other GIS and external databases to the street addressing system. For example, the street codes are linked with the networks infrastructure system such as water supply, electricity, telecommunication; land parcel and property taxation and other municipal applications.

Street GIS Data Model Street GIS, collectively is an information system with spatial components defined by geometric objects (point, line and polygon) with their specific properties and behaviors defined by attribute data. The geometric objects have topological properties associated with its types. The street topological model is defined by points for road junctions, where the street network lines connect; street network lines (street centerlines) are represented by lines and the form width by polygon (generally at larger mapping scales i.e. 1: 2,000-1: 5,000). Besides these, the road edges are represented using line topology and are used for cartographic model. In general, the street addressing GIS database should contain the following information:

Addressing sector name and code

Access way code and name

Access way type

Access way surface type

Access way status

Access way width, length and other physical attributes

Access way traffic type

Chapter 5. Street addressing implementation at municipal level

Background

This chapter discusses the institutional framework, system infrastructure and human resources requirements for implementing the street and house addressing system. The detailed framework for development of these three essential components along with the strategy and methodology for updating the addressing system are presented in this chapter.

Institutional Framework

The first and foremost requirement for sustainably implementing Street Addressing System is to establish a “Street and House Addressing Unit “भवन तथा सडक ठेगाना इकाई“ under the Planning Section (योजना शाखा) in Tilottama Municipality. This unit shall collaborate and function collectively with other municipal departments and shall provide its services to all the departments within the municipality. The primary responsibility of this unit will be to manage and maintain data besides giving street naming. The other responsibility is to improve the performance of the existing tax system and reform the present system optimizing for the resource mobilization of the municipality.

Addressing Unit Establishment

Human Resource

In view of the present organizational structure of Tilottama Municipality it seems quite logical to establish one separate unit as Street and House Addressing Unit which will collaborate and function collectively with other departments of the Municipality and especially with the department which issues the building permit. As has been described early in this manual, the recruitment of personnel depends upon availability of the personnel with sufficient knowledge of this nature of the work within the municipality. If there are no such personnel available, the municipal office should recruit appropriate personnel. The recommended human resources are:

Table 3 List of recommended human resources

S.No	Personnel	Qty	Responsibility	Remarks
1	Engineer/Senior Overseer	1	<p>Coordination with the parent municipal department</p> <p>Oversee all the tasks in the unit</p> <p>Tasking to the sub-ordinate technicians</p> <p>Coordinate with local stake holders during street naming process</p> <p>Plan and undertake field monitoring, verification and updating</p> <p>Issue temporary/permanent house address certificates to public</p> <p>Plan for new installation of street signage</p> <p>Collaborate and support GIS unit in street updating, street and house address updating</p>	Head of the unit
2	Surveyor	1	<p>Conduct measurement of entrances of newly constructed houses for issuing new house number</p> <p>Collect the location of newly constructed buildings/houses to be updated in the database</p> <p>Support GIS unit of updating of street, houses and address database</p> <p>Assist the engineer in planning new installation of street signage</p> <p>Undertake new installation of street signage and building number plates</p> <p>Assist computer operator in updating the database</p>	With basic surveying training and basic computer knowledge
3	Computer Operator	1	Assist the engineer in data preparation, updating, analysis and map preparation	Computer literate, preferably with technical background (sub-overseer, computer operator, assistant surveyor etc)
4	Helpers	As required	Install street signage, house number plates	

Hardware System

For maintaining the addressing database, reporting and performing day-to-day office tasks for the aforementioned personnel of the unit, at least two networked computer systems with normal configuration and a printer is required.

Software System As all the GIS and mapping work is done in collaboration with the Municipal GIS Unit, special GIS software may not be required for the unit. However, it is recommended to have one unit of commercial GIS software provided funding is available. As an alternative, a free GIS tool such as Arc Explorer by ESRI, open source Map Window or other freely available GIS applications may be used to visualize and map the streets.

Other Equipment

Updating of street map in collaboration with other municipal departments/units is one of the major tasks of the addressing unit. Other tasks include installation of new street signage and building number plates. Therefore, the unit should be equipped with proper equipment's. These are the required equipment's:

Handheld GPS set – 2 units to maps newly constructed roads and buildings

GPS data downloading software – 1 unit to download GPS readings

Steel ladder to install street sign plaques on building walls

Lettering stencils, color paints, paint brushes/rollers etc. for temporary numbering until permanent metal plates are installed

Electric/hand drills, hammers, nails/screws etc. to install street signage and building number plates

Printed temporary and permanent house address certificate forms

Human Resources Development

Trainings need to be imparted to the recruited human resources such that the addressing unit can perform its tasks independently as well as collaborate with other municipal units for maintaining fully functional and sustainable addressing system in the municipality. The capacity building and human resources development programs through trainings should focus on the key functions of the unit. Such training program should contain the field enumeration, database management and installation of signage and building numbering trainings. Following trainings are recommended requirements for the addressing unit personnel.

Field Survey and Enumeration Training

This training is required for the head of the unit, surveyor and other junior surveyors such these personnel are able to undertake field surveying and enumeration for the update of the addressing system. This training should include the followings:

Field survey planning, execution and resources mobilization especially targeted to the unit head.

Development of skill in public relation such that the unit members can coordinate with the locals, concerned wards and other influential parties to cooperate in street naming as well as house numbering operations.

Training on using GPS sets for collecting data of newly constructed roads, locating new buildings for GIS data and address updating.

Training on using field measurement instruments such as odometer, measuring tape correctly to measure the metric distance for updating of house numbers.

Training on enumerating access ways and buildings for access way coding and house numbering.

GIS and Database Management Training

The GIS and data management trainings are necessary to systematically manage the addressing data, plan field surveying and enumeration process on the table, support GIS unit on updating the roads and buildings, provide services related to addressing to external line agencies. This training is recommended for all the unit members. The training should contain the followings:

GIS training focusing on updating of building, street and addressing spatial and attribute databases.

GIS based mapping training focusing on street map preparation.

Database management and reporting training.

GPS data processing training (downloading, integrating into GIS).

Signage and Numbering Training

This training is necessary to efficiently undertake street signage and building number installation operations. The requirements under this are:

Training on planning for locating the spots to install street signage given to the unit head.

Training on efficiently mobilizing the field installation team given to the unit head and the surveyor.

Training (orientation) on specification requirements for the street signage and building numbering plates.

Training (orientation) on installations of street signage and building numbering plates given to the field technicians and helpers.

Updating of Street Address

For the successful implementation of the addressing system in the municipality, regular updating of the streets addressing system is imperative. The municipality should formulate certain policy and institutional framework for updating the addressing system. This updating policy and institutional framework is also governed by the availability of resources including the human resources. Hence, the addressing unit should have a clear mandate as well as technical and infrastructural capability to undertake the updating operations. The policy should be such formulated that the updates are carried out at municipal level as soon as the roads and buildings are constructed. This might require frequent updating at municipal level,

but the benefit is having an advantage of up-to-date street and building database and their respective addressing system. Frequent updating might also eliminate the need of hiring and external consultant to do the mass updating, which otherwise would be necessary. The following sub-sections provide a general road map for undertaking the updating operations:

Updating Roads and Street Addressing

When a new road is constructed, the addressing unit should seek for the acquisition of the design drawing and layouts with the concerned line agency or with the contractor/consultant involved in the construction. Such design layouts, in general are in CAD digital format as well as in printed maps. The addressing unit should verify the compatibility of such layout drawing with the Municipal GIS system. The digital drawing is then converted to compatible GIS data format with associated attribute data.

In case, design layout is not available, the roads are updated using handheld GPS sets. In this method, the surveyor traverses along the centerline of the constructed road, taking GPS readings at every turning point. Other relevant information such as road width, pavement type, side-drain and other structures constructed and other are recorded. The recorded GPS points and the surveyed route are plotted on the base map in GIS environment. Associate data collected are entered as attribute data of the road.

Once the road map and GIS data is updated, the access way is given a code according to the coding specification. The addressing unit holds a public counseling for the naming of the new access way. The name is approved by the municipality and the access way is officially designated a name.

The GIS and database are also updated accordingly with new access way code and designated name.

□ Street signage (street plaques or street sign post) is installed at the appropriate location for the new access road.

If in case the buildings/houses along this newly constructed road have not obtained permanent house numbers (due to temporary status of road such as bund (अँली), under construction road or others), these houses are given permanent house numbers and house number plates. The GIS and database of such buildings are also updated accordingly.

Chapter 6 Addressing system application at municipal Level

General

This chapter briefly presents some of the applications of addressing system that will enable effective resource mobilization, service delivery and internal revenue generation in the municipality.

Addressing System for Municipal Taxation

The addressing system identifies each building (residential or non-residential) with the designated building number and road name unique to an individual building only in the whole of the municipality. As such, the municipal taxation system by incorporating the house number can clearly identify each building, evaluate its payable tax value, bill the tax invoice to a specific building address as well as monitor the tax payables. This increases the efficiency and transparency of property/business tax collections thus improving the internal revenue collection of the municipality. The municipal taxations system should be such that it can generate tax bills for each taxable buildings/business and send to the tax payers via standard postal mail addressed to the house number in a particular street.

Delivery and Maintenance of Utility Services

The municipality and other utility services can improve their service delivery and bill collections by incorporating addressing system in their service procedure. For an instance a utility service provider can correctly and quickly identify the building where maintenance service is required upon the complaint from the customer. Similarly, the utility bills can be sent to the customer in the correct address thus enabling effective bill collection.

Postal System

Postal system and courier services can efficiently and correctly deliver the mails and parcels to the intended recipient if the addressing system is used properly. For an instance, the recipient can use the addressing system as shown. The house number 12 in Tapaha Road located in ward 2 in the Tilottama North sector will enable postal service to deliver the post at the address.

Emergency Responses services

Emergency services including police, ambulance, fire station and other emergency response services can quickly reach the emergency locations react effectively if they know where such emergency service is needed. The addressing system plays a vital role in correctly identifying the location/building and respond accordingly.

Tourist Maps

Publication and sales of tourist maps can generate some revenue to the municipality. This will also help as publicity tool to attract more visitors to the city, generating revenues.
